Field of the Invention The present invention relates to an image forming apparatus such as an electrophotographic copying machine or an electrophotographic printer (for example, a laser beam printer). 2. Description of the Related Art There is a so-called tandem-type image forming apparatus including a plurality of image forming units disposed in parallel to one another in an electrophotographic recording medium conveying direction, and an intermediate transfer belt which is disposed to face the plurality of image forming units through an interval along the electrophotographic recording medium conveying direction and travel in an endless path. Toner images formed on the respective image forming units are sequentially transferred onto the intermediate transfer belt to be superimposed. A latent image formed by an exposure operation is formed on a surface of the intermediate transfer belt at a position opposite to each of the image forming units and the latent image on the surface of the intermediate transfer belt is developed into a toner image by using the toner image formed on the image forming unit which is opposite to the position on the surface of the intermediate transfer belt. The toner image is then transferred onto an electrophotographic recording medium. The toner images formed on the respective image forming units are superimposed to be transferred onto the intermediate transfer belt. The toner images superimposed on the surface of the intermediate transfer belt are secondarily transferred onto the electrophotographic recording medium to be outputted. The images formed on the respective image forming units have different displacements from the position of the exposure operation due to the deviation in pitch between the respective image forming units in the tandem-type image

Inactivation of N-linked oligosaccharides in the chicken egg-white lysozyme by endo-beta-N-acetylglucosaminidase H and P sequence - P/j subunits are not N-linked glycoproteins. Egg-white lysozyme (EWL) is the prototypic glycoprotein of chickens and undergoes an N-linked oligosaccharide processing during its biosynthesis. The enzymatic hydrolysis of the N-linked oligosaccharide was assayed with intact N-linked oligosaccharides of native and deglycosylated chicken EWL. In a recombinant f678ea9f9e
